

The world's most intense satellite urban heat islands are largely a reference-elevation artifact

Of the 100 most-intense SUHIs worldwide:

97 / 100 displaced from the top 100 after correction

98 % are high-terrain cities (vs 20.4% baseline)

$\rho = 0.68$ conventional vs corrected ranking

Dominated by the Himalaya-Tibet, Andes, Iranian and N. American cordillera.
A within-city correction and a global per-city dataset are released.
